Dating Website
(Like Mutual or Tinder—only not a mobile app)

Project Description:

We're going to make a dating website which allows users to view pictures and a short bio of users of the opposite sex and then say "yes, I'm interested" or "no, I'm not."

That's the basic functionality, but additional functionality could include the ability to search for people with keywords in their bio (like "Music" or "Hiking") and improved suggestions (not just random profiles) based on user-defined tags.

Team

I'm looking for one person to join the team (proficiency in PHP and Javascript preferred)

SQL

We'll be using MySQL

No-SQL

Probably a key-value database

Business

I'm not planning on making any money off of this, but I suppose we could look into adding google ads or other advertising to "keep" the website free.

We could also add a "Premium" membership or even a subscription which gives members/subscribers certain benefits (not sure what yet though)

Legal

Get the user's consent to share any information they provide with others on the website.

Technical

We will be using PHP as our back-end processing language. Basic website functionality (pictures and bio + "yes" or "no" buttons) comes first, but I imagine we'll have plenty of room to experiment with other features (suggestions welcome).
